# Deskbird Growth Analytics

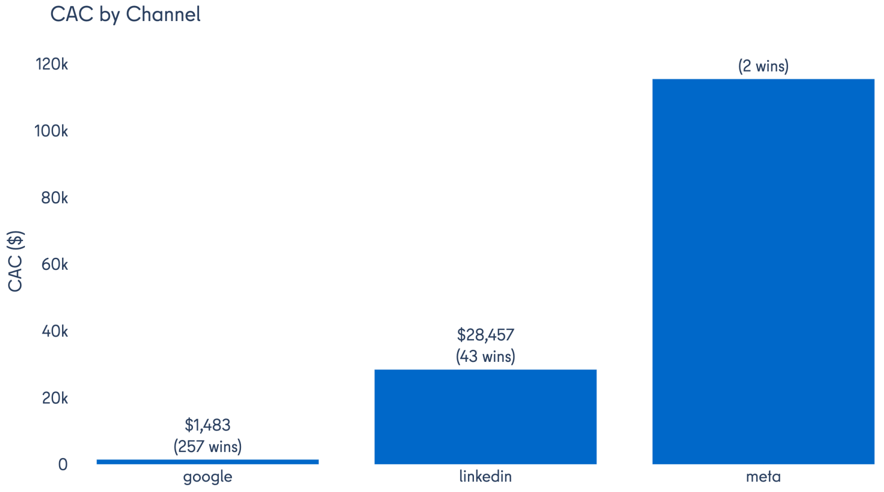
## Sr. Growth Analyst Take-Home

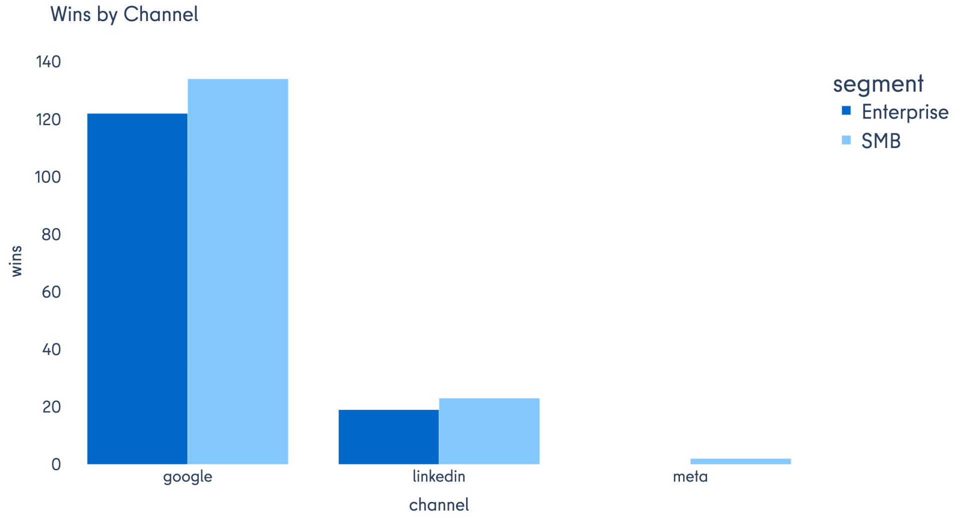
- Fictional pseudo-data · Jan 2025 – Jun 2026
- 3 domains: Paid Ads · CRM Pipeline · Product Usage
- 5 markets (DE, AT, CH, UK, US)
- 3 channels (Google, LinkedIn, Meta)
- Reproducible: make all → dbt → Streamlit → this deck

# Insight 1 - Ads - LinkedIn vs Google: CAC gap is not deal size

We compared customer acquisition cost (CAC), win counts, and spend by paid channel (Google vs LinkedIn), then checked whether deal size explains the gap — average contracted seats and Enterprise vs SMB win mix.

**Why it matters: LinkedIn burns budget without proportional wins; Google scales SMB and Enterprise efficiently.**
**Actions: Reallocate LinkedIn unless brand or Account-Based Marketing goals justify it. Scale Google for volume.**



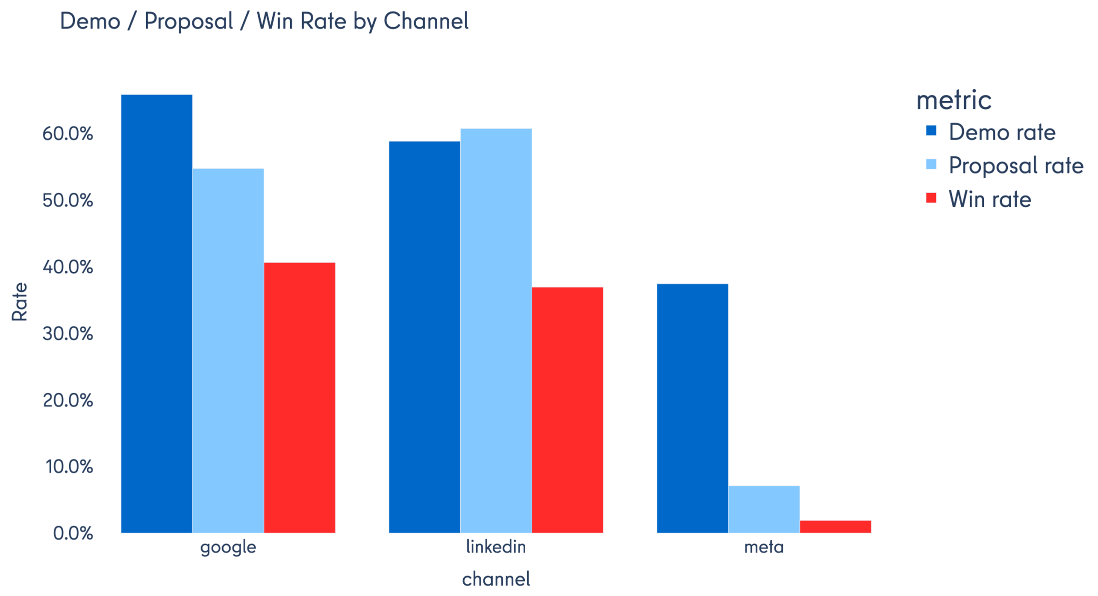


Google: ~$1.5k CAC · ~257 wins · ~$381k spend
LinkedIn: ~$28k CAC · ~43 wins · ~$1.2M spend (~3× budget)
Avg seats ~295 on both; Enterprise mix ~47% — deal size does not explain the gap
Google: ~4× lead volume, ~5× lower CPC, ~3× higher CTR

# Insight 2 - Ads - Meta delivers leads but fails to close

We traced Meta from ad delivery through CRM funnel stages (lead → call → demo → proposal → win), comparing stage conversion rates and CAC to Google and LinkedIn.
Meta shows strong top-of-funnel performance — ~4.3% click-through rate, lowest cost per click, and the most leads — but only 2 wins on ~$230k spend (~$115k CAC).
The drop happens after demo: demo→proposal ~7% vs ~55% on Google/LinkedIn; call→demo ~37% vs ~66%. Meta fills the top of the funnel but does not convert through sales stages.

**Why it matters: Meta is an awareness and volume channel, not a scalable close channel.**
**Actions: Audit targeting and post-demo motion before scaling. Check Meta landing pages and creative. Pause spend if ideal-customer-profile mismatch is confirmed.**



Meta: ~$115k CAC · ~4.3% CTR · ~$230k spend · 2 wins
Strong top-of-funnel (highest CTR, lowest CPC, most leads)
Demo→proposal ~7% vs ~55% on Google/LinkedIn;
call→demo ~37% vs ~66%

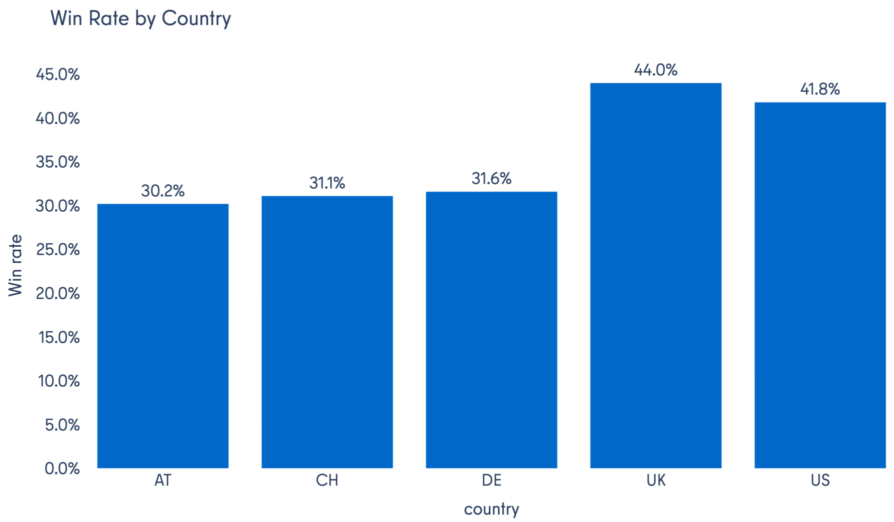
# Insight 3 - CRM - UK/US win faster than DACH — velocity, not lead quality

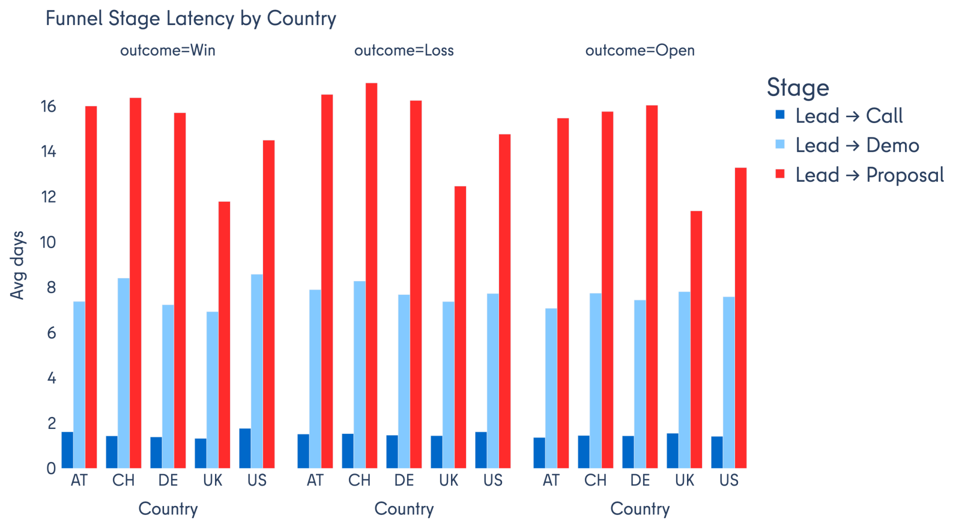
We compared proposal-to-win rates and funnel stage latency by country (UK, US, DACH). UK (~44%) and US (~42%) proposal→win rates beat DACH (~31%), yet early funnel rates match (~30% demo→proposal) and average deal sizes are similar (~295 seats).

UK and US move faster: ~13 days lead→proposal vs ~16 days in DACH; ~25 days lead→win vs ~32 days. Higher win rates track how fast deals move, not lead quality or deal size.

**Why it matters: Market-specific velocity drives close rates.**

**Actions: Set market-specific targets and close playbooks. Prioritize DACH proposal-stage speed.**





UK ~44% and US ~42% proposal→win vs DACH ~31%

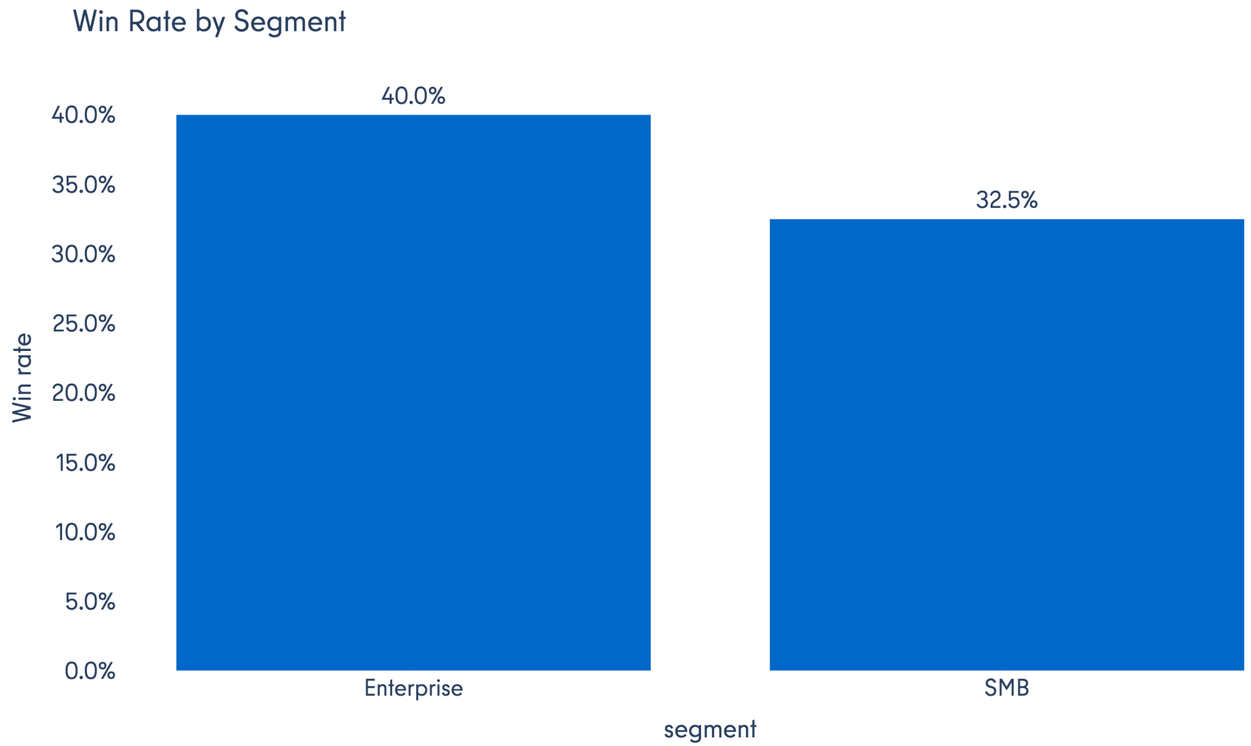
Early funnel rates match (~30% demo→proposal); deal sizes similar (~295 seats)

UK/US: ~13d lead→proposal vs ~16d DACH; ~25d lead→win vs ~32d DACH

# Insight 4 - CRM - Enterprise closes the deal better

We split proposal-to-win rates by segment (Enterprise vs SMB) and checked whether the gap holds across markets and acquisition channels. Enterprise proposal→win ~40% vs SMB ~33%; the gap persists in DACH (36% vs 28%) and on Google (46% vs 37%) and LinkedIn (41% vs 34%). Segment and market both shape close rates.

**Why it matters: Enterprise and SMB need different close motions, especially in DACH.**
**Actions: Enterprise close playbooks, especially in DACH. Diagnose SMB proposal-stage drop-off separately.**

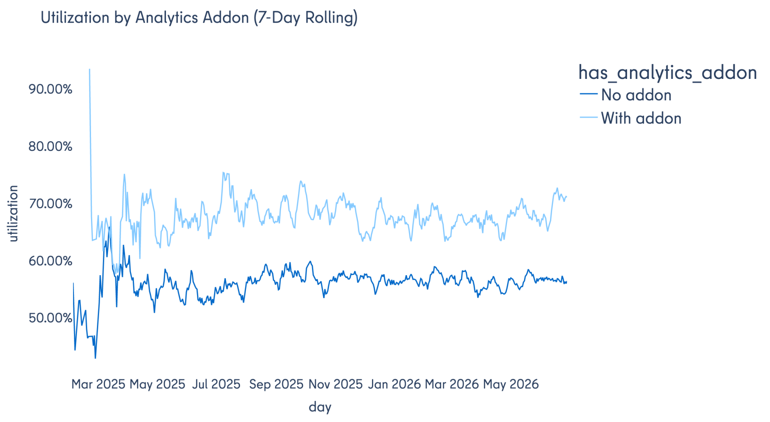


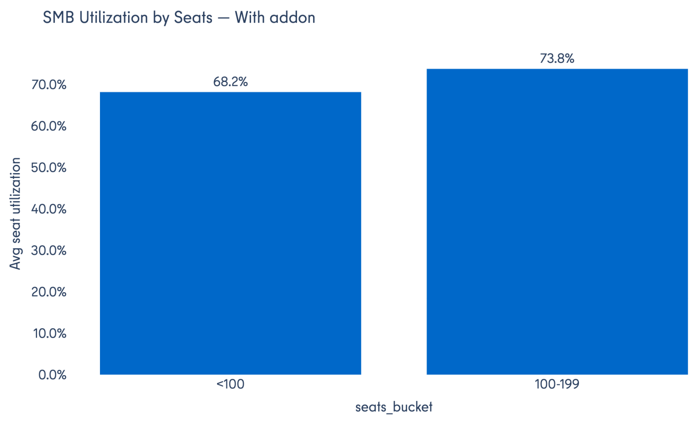
- Enterprise proposal → win ~40% vs SMB ~33%
- Gap persists in DACH (36% vs 28%) and across channels (Google 46% vs 37%)
- Deal size differs (~515 vs ~106 seats) but timing to proposal is similar (~15d)

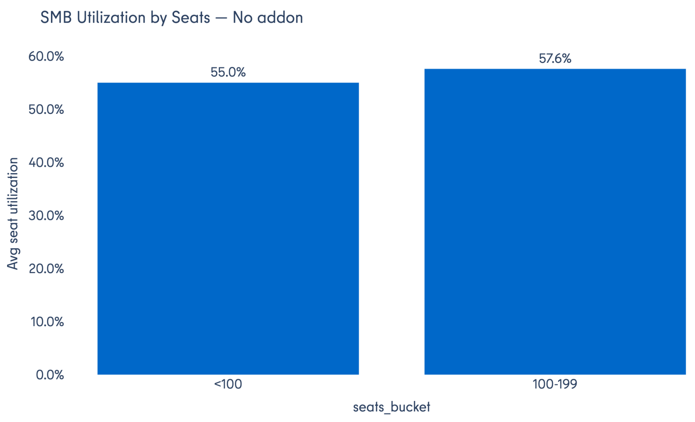
# Insight 5 - Product - Analytics addon lifts SMB utilization

We measured seat utilization (active seats ÷ contracted seats) by analytics-addon status, segment, and seat bucket.
Baseline utilization sits ~50-65% across seat buckets with no clear segment winner. With the analytics addon, SMB utilization jumps to ~72% vs ~56%; Enterprise shows no addon lift (~54% vs ~57%).
Product usage depends on analytics where it is adopted specifically for SMB.

**Why it matters: The analytics addon is a lever for SMB engagement, not Enterprise.**
**Actions: Package analytics for SMB — default attach, trial, or bundled tier.**



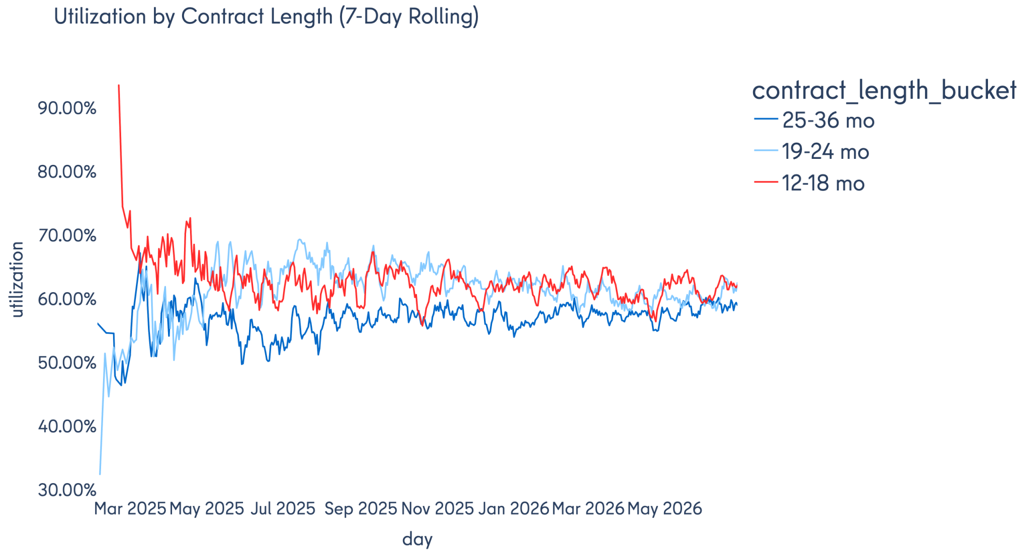


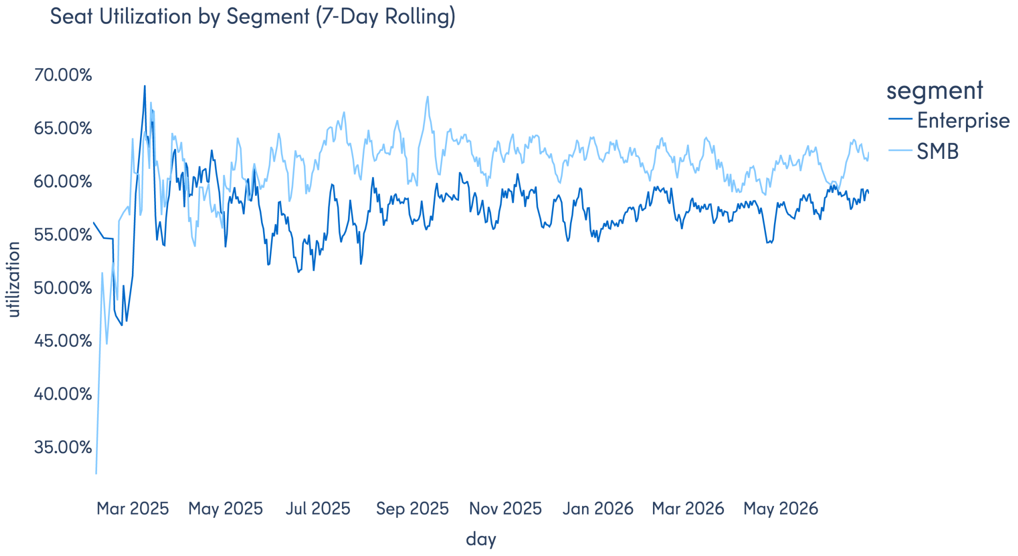


# Insight 6 - Product - High-value accounts: lowest utilization and churn risk

We compared seat utilization by contract length and segment, focusing on accounts with the highest renewal value.
Contract length 25-36 months averages ~56% utilization vs ~60-64% for 12-18 and 19-24 month buckets. Enterprise ~56% vs SMB ~63% — longer contracts, more seats, lower engagement.
The most valuable clients are the hardest to keep engaged.

**Why it matters: High-value, low-engagement accounts are the primary churn risk cohort.**
**Actions: Proactive customer success for Enterprise and 25-36 month cohorts — onboarding health checks, executive QBRs, utilization targets, analytics addon push.**





# Metrics to Monitor

| Domain | KPI | Formula / grain | Use |
|---|---|---|---|
| Ads | CAC | spend ÷ won clients · campaign × month | Channel efficiency vs deal size |
| | Spend share | channel spend / total | Budget allocation |
| | CTR / CPC | clicks÷impressions · spend÷clicks · daily | Delivery quality |
| | Lead → funnel rate | CRM leads ÷ ad clicks | Top-of-funnel capture |
| CRM | Stage conversion rates | calls÷leads … wins÷proposals | Funnel drop-off by step |
| | Win rate | wins ÷ proposals | Sales effectiveness |
| | Funnel stage latency | avg days lead→call/demo/proposal | Velocity by outcome/market |
| | Open pipeline | leads without terminal stage | Forecasting |
| Product | Seat utilization | seats_active ÷ contracted seats · client × day | Engagement / retention proxy |
| | Feature adoption rate | adopt users ÷ login users · month × feature | Product stickiness |
| | Utilization by addon | util split on has_analytics_addon | Addon ROI |

# Five Core Growth Metrics

| Metric | Definition | Grain | dbt model | Why it matters |
|---|---|---|---|---|
| CAC | Ad spend ÷ won clients | provider × campaign × month | metric_cac | Links spend to actual wins; exposes channel efficiency |
| Lead → funnel rate | CRM leads ÷ ad clicks | month × channel × country × segment | metric_funnel_rates | Measures top-of-funnel capture after click |
| Win rate | Wins ÷ proposals | same | metric_funnel_rates | Tracks sales effectiveness at close |
| Time to activation | won_at → contract_start | lead / client | fct_lead_journey + metric_funnel_stage_latency | Onboarding velocity; early churn signal |
| Seat utilization | Seats booked ÷ Seats contracted | client × day | metric_seat_utilization | Engagement proxy ahead of renewal risk |

# Data Model

The raw data is generated from scripts/generate_data.py and saved data/warehouse.duckdb. There analytics data layer is built on top across raw → staging → intermediate → marts → metrics schemas.
